only. Missile development is a multi-dimensional business —if you remain in any one dimension for a long time, you wil get stuck.

My initial few months at DRDL were largely interactive. I had read at St. Joseph's that an electron may appear as a particle or wave depending on how you look at it. If you ask a particle question, it wil give you a particle answer; if you ask a wave question, it wil give you a wave answer. I not only described and explained our goals, but also made them an interplay between our work and ourselves. I stil recal quoting Ronald Fischer at one of the meetings, "The sweetness we taste in a piece of sugar is neither a property of the sugar nor a property of ourselves. We are producing the experience of sweetness in the process of interacting with the sugar."

Very good work on a Surface-to-Surface missile with a vertical riseturn straight line climb-bal istic path had been done by that time. I was astonished to see the determination of the DRDL workforce, who, in spite of the premature winding up of their earlier projects, were eager to go ahead. I arranged reviews for its various subsystems, to arrive at precise specifications. To the horror of many
