sometimes slip into astrology. Quite honestly, I have never real y understood the reason behind the great importance attached by people to the faraway planets in our solar system. As an art, I have nothing against astrology, but if it seeks acceptance under the guise of science, I reject it. I do not know how these myths evolved about planets, star constel ations, and even satel ites—that they can exercise power on human beings. The highly complicated calculations manipulated around the precise movements of celestial bodies, to derive highly subjective conclusions appear il ogical to me. As I see it, the Earth is the most powerful and energetic planet. As John Milton puts it so beautiful y in Paradise Lost, Book VI I:

. . . What if the Sun
Be centre to the World, and other stars . . . . .
The planet earth, so steadfast though she seem,
In sensibly three different motions move?

Wherever you go on this planet, there is movement and life. Even apparently inanimate things like rocks, metal, timber, clay are ful of intrinsic movement—with electrons dancing around each nucleus. This motion originates in their response to the confinement imposed on them by the
