Aeronautics is a fascinating subject, containing within it the promise of freedom. The great difference between freedom and escape, between motion and movement, between slide and flow are the secrets of this science. My teachers revealed these truths to me. Through their meticulous teaching, they created within me an excitement about aeronautics. Their intel ectual fervour, clarity of thought and passion for perfection helped me to launch into a serious study of fluid dynamicsmodes of compressible medium motion, development of shock waves and shock, induced flow separation at increasing speeds, shock stal and shock-wave drag.

Slowly, a great amalgamation of information took place in my mind. The structural features of aeroplanes began to gain new meanings— biplanes, monoplanes, tail ess planes, canard configured planes, deltawing planes, al these began to assume increasing significance for me. The three teachers, al of them authorities in their different fields, helped me to mould a composite knowledge.

My third and last year at MIT was a year of transition and was to have a great impact on my later life. In those days, a new climate of political enlightenment and industrial
