12. For a contextualization of the mixture of Arabic and Persian in the date, cf. Giunta 2010: 177.
13. After Casimir and Glatzer 1971; Glatzer 1973; Blair 1985: 81; Najimi 2015. See also Ball 2019: No. 1023.
14. Recorded only by Najimi (2015: 154); unfortunately, the author did not include a photograph of this previously unread inscription.
15. Najimi (2015: 157, 167) proposed the identification of this *takbīr*; but see Chapter 4.
16. Described as a specifically Shi'ī Ḥadīth by Najimi (2015: 162–163), though varying versions of it are to be found in Sunnī Ḥadīth collections as well – cf. Chapter 4.
17. As was the case with Bust (cf. *supra*), this volume's focus on the initial expansion of the Shansabānīs beyond Ghūr has required that treatment of the abundant funerary markers (principally tombstones) be undertaken in Volume II (cf. also Giunta 2003a; Giunta 2003b; Giunta 2017).
18. Only forty-four slabs were excavated *in situ*, principally on the west but also on the east and north dadoes of the courtyard; another 344 slabs were not *in situ*. According to Bombaci's (1966: 6) calculations based on the average width, a total of about 510 slabs could have comprised the dado revetment of the palace's interior courtyard. The marble dado was placed below the baked brick and stucco epigraphy above it (V: 5), probably datable to the Shansabānī occupation of the palace. Cf. also Bombaci 1966: 33–36; Artusi 2009; Rugiadi 2009: 108ff.; Giunta 2010a: 164–166; Allegranzi 2019 (2 vols.); Allegranzi 2020a; Ball 2019: No. 358; Laviola 2020: 28–29.
19. These marble dado elements are to be distinguished from V:3–4, being associated primarily with the northern entrance to the palace, or Hall XVII in the excavated palace's plan (see, e.g., Allegranzi 2019a, vol. I:71). Already in the early seasons of excavations at the site, Scerrato (1959b, cited in Giunta 2010b) had suggested they formed an independent epigraphic program, contained within the north entrance alcove and separate from the larger compositions of the central court. Cf. Rugiadi 2010: 2 (also cited in Allegranzi 2020a). Giunta (2010b: 125) intriguingly observed that benedictory phrases – albeit with some modifications – commonly occurred also on metalwork from eastern Iran during the eleventh–thirteenth centuries. Cf. Laviola 2020: 456–457.
20. See esp. Bombaci 1966: 3, 19–20, figs. 131 and 133–136; Giunta and Bresc 2004: 171–172, 213–214; Giunta 2010a: 123–125; Kalus 2017: Fiche Nos. 36936, 36938, 43574, 43578, 43580, 43594, 43602, 43654. The rediscovery of these fragments and their reconstitution as one element was paramount, as they likely date the addition of the western oratory (XIII on the excavated palace's plan [Allegranzi 2019a, vol. I:71]) to the reign of Mas'ūd III (r. AH 492–509/1099–1115 CE).
21. The reading of Kalus (2017: Fiche No. 36936) is followed here; Giunta (2010b: 124) transliterated the date as corresponding to خمس و خمس مایه.
22. This inscription does not figure among Kalus's (2017; cf. note *supra*) re-readings of the published texts, so that Giunta's (2010b: 123) transliteration is followed here.
23. Bombaci's (1966: 13–15) initial epigraphic analysis of these extremely
