32. Bronson 1988: 200. Cf. also Vasjutin 2003: 51.
33. The poet Niẓami ʿAruḍi (fl. twelfth century) used the nomenclature in his *Chahar Maqala* ([trans. Browne] 1921: 8). Juzjani's explication of the mythical progenitor Shansab (or Shanasb) was itself derived from a lost genealogical work by Fakhr al-Din Mubarak-shah al-Marwarruzi, a *nadim* of Sultan Ghiyath al-Din – not to be confused with Fakhr-i Mudabbir (cf. also Chapters 1 and 6). See Juzjani, vol. I, 1963: 318–319 (trans. vol. I, 1881: 302); also Siddiqui 2010: 18.
34. Juzjani, vol. I, 1963: e.g., 318 (trans. vol. I, 1881: 300). See esp. O'Neal (2013: 22–30) for an informative overview of the historiography, beginning with the European "discovery" of the Shansabanis as Persian historical texts underwent translation in the late seventeenth century, through studies dating to the early to mid-twentieth century. Cf. Patel 2017 for modern scholarship in Persian.
35. The seemingly paradoxical tendencies of the long-term *effects* of dynastic lineages and their ephemerality appears to have been endemic to nomadic empires, as observed of the transregional nomadic empire(s) *par excellence* (Burbank and Cooper 2010: 93 and *passim*): "The empires established by Mongols were not long-lived, at least when compared to Rome or Byzantium. What makes Mongols count in world history are the connections they made across Eurasia and the imperial technologies they adapted, transformed, and passed on to later polities."
36. Among the initial recalibrations of methodology for the archaeology of nomadic societies has been Cribb's work (1991), emphasizing the indices of mobile groups' encampments within areas of study. Thomas (2018: 17, 50) effectively deployed the resulting concept of an archipelagic landscape, coined by Adam T. Smith, in which "urban centers [are] small islands of data linked by ephemeral networks in a sea of general obscurity" [!]. See also Stark 2005; Stark 2006a, 2006b; and Thomas and Gascoigne 2016: 173–176.
37. Cf. *supra* in main text; also Barfield 1981: 102–103; and Crossley 2019: 15–16
38. Notwithstanding the outdated generalization of "Middle Eastern Tribalism," particularly apropos here are Ernest Gellner's (1983: 422; *ibid.*, 445) early observations summarizing the contributions to a volume principally on tribal–pastoralist groups in Iran and Afghanistan: "These tribal societies are accustomed to a level of technology, in their agricultural, pastoral, military and domestic equipment, which seems to pre-suppose centres of artisan production and trade, in other words towns …" Given the nuancing over time of nomad–sedentist interactions, however, Elliott (2013: 6) proposed modifying Gellner's (1983: 447) earlier characterization of "the [nomadic] tribe [as] the anti-state" as actually a relationship that is *both* symbiotic and oppositional, already implied by Bronson (1988).
39. Certainly, the Afghan Boundary Commission reports of the mid- to late nineteenth century make constant reference to nomadic communities, a characteristic also photographed by Donald Wilber around Herat in the 1930s, and by the indefatigable Josephine Powell throughout Ghur during the 1960s (cf. *infra* in main text). These images harmonize with A. Kohzad's "tour reports" (see esp. 1951a; 1952; 1954a; 1954b; also discussed in Chapter
