Russia–Iran assistance to Afghanistan's Northern Alliance in its resistance against the Taliban.

The two countries signed a Declaration on Strategic Partnership, institution-alised the practice of annual summits, and set up an elaborate dialogue mechanism to generate and implement initiatives of bilateral cooperation. This included interactions of national security advisors and two inter-governmental commissions at the ministerial level – one for defence cooperation and the other for economic, scientific, and cultural cooperation – each with a number of working groups and subgroups.

The most important impact of the rejuvenation of India–Russia relations was on defence cooperation. India's purchases included the Su-30MKI aircraft, a range of helicopters, T-90 tanks, armoured vehicles, missile systems, stealth frigates, and diesel-electric submarines, to take a broad representative sample. Some unique templates were developed for defence cooperation. The India–Russia joint venture Brahmos, which started with the manufacture of an anti-ship supersonic missile designed in Russia, has developed versatile missile systems for Army, Navy, and Air Force weapons platforms. In new platforms like the Su-30 aircraft and stealth frigates, Russian manufacturers have accommodated Indian requests for alterations of specifications and design modifications. Russian manufacturers have also collaborated with French and Israeli companies on technology insertions requested by India. In many cases, India was the first or the largest customer for new Russian platforms. The Indian Navy received the naval version of the MiG-29 aircraft before the Russian Navy did. The Indian Armed Forces now operate more Su-30 planes and T-90 tanks than the Russian Armed Forces.[6]

As indicated by President Putin in his speech to the Indian Parliament, cooperation in nuclear energy was pursued
