great power rivalry. Over the last decade, we have seen both developments taking place simultaneously, and in this volume, Prasad discusses how both balance-of-power politics and increased interdependence are required as two parallel tools for stability in the Indo-Pacific region. This combination of cooperation and competition is also reflected in India's approach on China. Nevertheless, is this mix sustainable over the long term, will the forces of globalisation and economic interdependence be strong enough to modify great power rivalry in the region, or will the forces of rivalry prevail and gradually undermine economic cooperation? Despite India's growing economic links with China, their economic cooperation has not reached a level of complex interdependence, and their economic ties could easily be derailed. Just as the United States and Europe are currently grappling with how to balance the security-economy nexus vis-à-vis China, with the debate about Huawei, 5G, and critical infrastructure dominating the agenda, India also has to find a solution to these dilemmas.

India has a number of considerations to take into account in its foreign policy over the next 10–20 years. While India has to grapple with the opportunities and challenges related to its own emergence as a great power, its foreign policy will above all be shaped by how the distribution of power between China, the United States, and India plays out; by the degree of China's assertiveness and presence in India's neighbourhood; and by the level of commitment the United States attaches to the expanded Indo-Pacific theatre.
