- Visual Studio Code or any code editor
- **Basic knowledge of Laravel**

> *This lab uses **PHP 8.4**, **Laravel 12** and **Visual Studio Code** as the primary editor.*

10.5.4 SQLite Driver Notes

We need to ensure the SQLite driver is installed and enabled in your PHP configuration.

- **Windows:** SQLite is included with Laravel 12 but needs `sqlite3.dll` in `php.ini` (`extension=sqlite3`).
    - Download SQLite from https://www.sqlite.org/download.html
    - Download SQLite 32-bit DLL
    - Put `sqlite3.dll` in `ext` folder.
- **Linux/macOS:** SQLite is pre-installed, but you may need to install the PHP extension:

```
sudo apt install php8.x-sqlite3  # Ubuntu/Debian
sudo dnf install php-sqlite3     # Fedora/CentOS
```

We also ensure `php.ini` has the SQLite extension enabled:

```
extension=pdo_sqlite
extension=sqlite3
```

Save the file. Ok, we're ready to build our Todo app!

> *You may check chapter 1 for more details about installing SQLite and PHP.*

10.5.5 Steps

Here are the steps to complete this lab:

10.5.5.1 Step 1: Create a New Laravel 12 Project

First, we need to create a new Laravel project. Open a terminal and create a new Laravel project:
