This code defines the view for displaying the paginated product list. It uses **Tailwind CSS** for styling the table and pagination links. The `{{ $products->links() }}` method generates the pagination links automatically.

The `links()` method generates the pagination links based on the current page and the total number of pages. It uses **Tailwind CSS** classes for styling the pagination links.

10.8.4.8 Step 8: Run and Test

After completing all the steps, we can now test the application. Run the following command to start the Laravel development server:

```
php artisan serve
```

Visit:
http://localhost:8000/products

You should see a paginated table of products styled with **Tailwind CSS** and working pagination links.

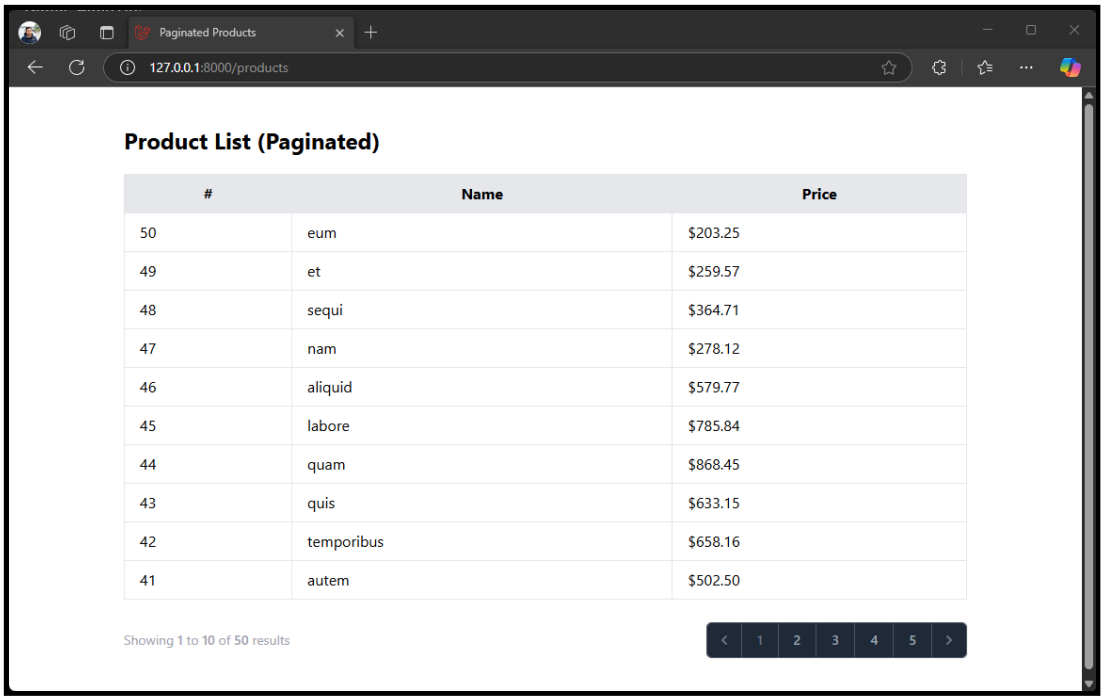

Figure 10.14: Paginated Products.

Try to navigate through the pages using the pagination links at the bottom of the table. You should see different products on each page.
