1.7 Laravel Directory Structure and Conventions

Once installed, your Laravel project follows a clean and modular directory structure:

```
myapp/
├── app/                # Core application code (MVC)
│   ├── Console/
│   ├── Exceptions/
│   ├── Http/           # Controllers, Middleware, Requests
│   └── Models/
├── bootstrap/          # App bootstrapping (autoloaders)
├── config/             # Configuration files
├── database/           # Migrations, seeders, factories
├── lang/               # Language localization
├── public/             # Entry point for web server (index.php)
├── resources/          # Views (Blade), assets (CSS/JS)
├── routes/             # Web/API/Console routes
├── storage/            # Logs, compiled views, file uploads
├── tests/              # Unit and feature tests
└── vendor/             # Composer dependencies
