starting with the Mughals while emphasizing the differences between Hindus and Muslims ('Urdu Lazmi' 9 and 10 Grades, Sindh Textbook Board 2016).

Furthermore, the history section of Grade 5's Social Studies textbook printed by all three textbook boards begins with a chapter comparing the 'Gregorian and Islamic Calendar', emblematic of the ideological emphasis on the distinction between Pakistan (read: Muslims) and the West. For the KP (2015–16b) and Sindh textbooks, this is followed by the 1857 War of Independence as the beginning of Pakistan's history, whereas the Punjab Textbook Board has opted to begin with Muhammad Bin Qasim, with a photograph of the Muslim ruler wearing the Arab 'keffiye'. While all three textbook boards emphasize the Islamic nature of the Pakistani identity, the Punjab Textbook Board is more prominent in locating the Pakistan identity within the Arabian Peninsula with its emphasis on Muhammad Bin Qasim. Hence, the Pakistani identity and the notion of a Pakistani citizen as defined by the education curriculum is limited not only to subjects that directly deal with identity and citizenship, such as Pakistan Studies, and Social Studies, but also to subjects that ought to be neutral in teaching a language like English or Urdu, and these are just as likely to propagate a nationalist Islamic discourse.

This is the kind of knowledge and education that the participants in this study were exposed to during their time in school – their narratives of citizenship therefore reflect much of the ideology that such textbooks and education systems promote in Pakistan. While this was particularly true for those who followed the government curriculum, the research engaged with students across the system.

Previous research (Lall 2012) shows that the type of school in which young people are educated is closely associated with views on citizenship and the state. It is difficult to infer that the type of school is solely responsible for the attitude of the children, since particular family views and/or a perceived school ethos might determine school choice. For example when middle-class parents choose a graduate madrassa for their children they will expect the teaching to reflect a religious vision, possibly even a belief that religion should be determining in how the state is run. However, when it comes to other school types it is unclear if parents factor in ethos when making their choice, or if the practical considerations (distance, infrastructure, cost, etc.) play the paramount role.

Different types of schools, however, do impart different visions and views of the state through how and what they teach.[7] With higher education and madrassas this is obvious as students in colleges or universities are exposed to a diversity of views and increased critical thinking; in madrassas mostly the opposite holds true. Private schools catering to the elite almost always bring in upper-middle-
