courts, the procedures for trying such cases were still being streamlined. The case of Naila Rind especially highlights the disconnect between such laws and their implementation. Naila Rind was a graduate student at Sindh University who committed suicide after being blackmailed with 'pictures and videos' by a man whom she met on Facebook. In her case, the police were clueless about the nature of PECA 2016 in relation to sexual harassment. As the founders of the Digital Rights Foundation highlighted, the state was 'in a rush to pass perfunctory laws such as the PECA without thinking over the implementation or plan to educate law enforcement agencies and the judiciary on the law' (Dad and Khan 2017). While it is important to have laws that address the problem of online sexual harassment, the security state has spent more time mainstreaming its surveillance strategy under PECA 2016, rather than streamlining the process of complaints and prosecution in cases of online sexual harassment and abuse.

In essence, the scope of the cybercrime law is largely undefined, giving almost unlimited powers to state officials in their surveillance of the internet. As Kamal highlights, any 'act of displaying or transmitting information that harms the reputation of a person' can 'be construed to penalize satire, political expression or any other form of journalism' (Kamal 2017, p. 8). The action against a satirical news website 'the Khabaristan Times' highlights this problem, since the website was blocked 'on the grounds that it published "anti-state" content' (Aziz 2018).

This normalization and increased surveillance are further evident in the requests made by the Pakistani government to Facebook administration in its efforts to crack down on blasphemy and anti-state activity (Dawn 2015). For the purpose of transparency Facebook releases a Government Request Report (GRR) every six months that 'lists the number of requests for content removal, restriction, user data, and any other requests made by governments worldwide' (Kamran 2017). Between January to June 2017, as a result of such data sharing, Facebook restricted 177 pieces of content 'based on legal requests from the Pakistan Telecom Authority and Federal Investigative Agency' since the content violated 'local laws prohibiting blasphemy and condemnation of the country's independence' (Facebook 2018; see Table 5.1 and Table 5.2).

Such accusations of statements or activity against the 'independence' of the country, where the nature of these statements is open to interpretation, can lead to further curtailment of dissent and free speech. With the implementation of PECA 2016, and attempts by the interior ministry to work with Facebook to gain access to detailed information about individuals posting 'blasphemous' content
