```
Output:
Array
(
    [0] => Rita
    [1] => Sue
    [2] => Bob
)
```

Rita and Bob are going to be joined their friend, Sue. The order matters to us because of reasons, so we've told PHP to put the new element "Sue" into `$myArr`, starting at index `1`, and to remove `0` other elements. The end result is that Sue is comfortably sat between Rita and Bob.

Removing Elements

Removing elements from arrays is a little trickier than adding or changing them. PHP has a built-in function for destroying variables – `unset()` – which can also be used to remove an array element either by index or (for associative arrays) by key:

```
$staff = ["Alice", "Bob", "Russell"];
$crew = [
    'captain' => 'Sisko',
    'medic' => 'Bashir',
    'engineer' => 'OBrian',
];

unset($staff[0]);
unset($crew['engineer']);
print_r($staff);
print_r($crew);

Output:
Array
(
    [1] => Bob
    [2] => Russell
)
```
