Here's the class:

```
class CrewDataWrapper implements Countable, JsonSerializable
{
    public function __construct(private array $data)
    {
    }

    public function count(): int
    {
        return count($this->data);
    }

    public function jsonSerialize(): mixed
    {
        ksort($this->data);
        return $this->data;
    }
}
```

`Countable` objects must implement `function count(): int`, and `JsonSerializable` objects must implement `jsonSerialise(): mixed`. Both of these required methods are implemented.

Finally, we glue it all together with some procedural code:

```
$crew = new CrewDataWrapper([
    'major' => 'Kira',
    'general' => 'Martok',
    'captain' => 'Sisko',
    'doctor' => 'Bashir',
]);

debugCrew($crew);

Output:
$crew contains 4 officers.
{
    "captain": "Sisko",
    "doctor": "Bashir",
```
