```
    public function consumeFuel(int $amount): void
    {
        $this->fuelLevel -= $amount;
    }

    public function refuel(int $fuelAmount): void
    {
        $this->fuelLevel += $fuelAmount;
    }
}
```

Note that, unlike interfaces, we are free to use `protected` and `private` members. To use a trait within a class, the keyword `use` is placed inside the class declaration like so:

```
class Car
{
    use Engine;
}

class SpaceShuttle
{
    use Engine;
}

$golf = new Car();
$enterprise = new SpaceShuttle();

$golf->refuel(50);
$enterprise->refuel(18_000_000);

$golf->consumeFuel(10);
$enterprise->consumeFuel(500_000);

$golf->printFuelLevel();
$enterprise->printFuelLevel();

Output:
There are 40 litres remaining!
There are 17500000 litres remaining!
```
