```
namespace {
    print_r(get_declared_classes());
    print_r(get_declared_interfaces());
    print_r(get_declared_traits());
}
```

```
Output:
Array
(
    [0] => InternalIterator
    [1] => Exception
    [2] => ErrorException
    ...
    [238] => Application\SomeEnum
)
Array
(
    [0] => Traversable
    [1] => IteratorAggregate
    [2] => Iterator
    ...
)
Array
(
    [0] => Application\SomeTrait
)
```

The three functions demonstrated here – `get_declared_classes()`, `get_declared_interfaces()`, and `get_declared_traits()` – will return every class, interface, and trait currently declared. Notice that `enum SomeEnum` is in the declared classes array (there is no `get_declared_enums()` function), and the only declared trait is the one we explicitly declared in the `Application` namespace – there are no built-in traits in the core language.
