These functions are useful, but if you know exactly which class (or trait, or interface) you need, then the following functions can be used:

```
namespace Application {
    class SomeClass
    {
    }

    trait SomeTrait
    {
    }

    interface SomeInterface
    {
    }

    enum SomeEnum
    {
    }
}

namespace {
    var_dump(class_exists('Application\SomeClass'));
    var_dump(trait_exists('Application\SomeTrait'));
    var_dump(interface_exists('Application\SomeInterface'));
    var_dump(enum_exists('Application\SomeEnum'));
}

Output:
bool(true)
bool(true)
bool(true)
bool(true)
```

Note that the fully qualified name is required in all cases.

What Is It?

The built-in functions `get_class()` and `is_a()` can be used to check the class name of an object instance:
