```
$ sudo dnf install docker-ce docker-ce-cli containerd.io docker-buildx-
plugin docker-compose-plugin
$ sudo usermod -aG docker USER
```

Again, we add USER to the docker group if we don't want to prepend every docker command with sudo. More details for Docker on Fedora can be found here: https://docs.docker.com/engine/install/fedora/

MacOS/Homebrew

```
$ brew install docker
```

More documentation at https://formulae.brew.sh/formula/docker

Windows

Docker is available for Windows via the Docker Desktop GUI software (which is also an option for Linux and Mac systems), and can be found at https://www.docker.com/products/docker-desktop/.

Verify Docker Server

The quickest way to test that docker is working after installation is to launch a container, there's even one specifically designed for this purpose.

```
$ docker run hello-world

Hello from Docker!
This message shows that your installation appears to be working correctly.

To generate this message, Docker took the following steps:
 1. The Docker client contacted the Docker daemon.
 2. The Docker daemon pulled the "hello-world" image from the Docker Hub.
    (amd64)
 3. The Docker daemon created a new container from that image which runs
    the executable that produces the output you are currently reading.
```
