```
 4. The Docker daemon streamed that output to the Docker client, which sent
    it to your terminal.

To try something more ambitious, you can run an Ubuntu container with:
 $ docker run -it ubuntu bash

Share images, automate workflows, and more with a free Docker ID:
 https://hub.docker.com/

For more examples and ideas, visit:
 https://docs.docker.com/get-started/
```

If the docker server isn't running, you will see the following error:

```
docker: Cannot connect to the Docker daemon
```

This means that `dockerd` is not running which can be rectified by starting the Docker Desktop application, or using your system's service controls, for example:

Linux

```
$ sudo systemctl start docker
```

MacOS

```
$ open -a Docker
```

You can even start `dockerd` directly from the command line (which means it will run in the foreground and send all output to your shell):

```
$ sudo dockerd
```

More information can be found at https://docs.docker.com/config/daemon/start/

Images and Containers

The two fundamental building blocks of docker are *images* and *containers*. An image defines the filesystem contents and state of a container, and acts as a template for containers. The command `docker run hello-world` was an instruction to the Docker
