Heredoc also supports the same variable interpolation as double-quoted strings:

```
function getVarName ()
{
    return 'stardateStr';
}

$stardateStr = 'Stardate 43996.2';

$obj = new class
{
    public function getEnemy(): string
    {
        return "Borg";
    }
};

$str = <<<TNG
Captain's log, {${getVarName()}}. The Enterprise remains concealed in the
dust cloud. And, to my surprise, the {$obj->getEnemy()} have maintained
their position waiting for us to come out of hiding. I have no explanation
for their special interest in me or this ship.
TNG;

print $str . PHP_EOL;

Output:
Captain's log, Stardate 43996.2. The Enterprise remains concealed in the
dust cloud. And, to my surprise, the Borg have maintained their position
waiting for us to come out of hiding. I have no explanation for their
special interest in me or this ship.
```

There is also an equivalent to the single-quote string literal: *nowdoc*. Nowdoc syntax is identical to heredoc, but with the identifier symbol declaration enclosed in single quotes (but the terminating identifier must not be quoted). Just like single-quoted strings, nowdoc does not perform any variable interpolation.
