```
print_r(mb_get_info());
```

```
Output:
Array
(
    [internal_encoding] => UTF-8
    [http_output] => UTF-8
    [http_output_conv_mimetypes] => ^(text/|application/xhtml\+xml)
    [mail_charset] => UTF-8
    [mail_header_encoding] => BASE64
    [mail_body_encoding] => BASE64
    [illegal_chars] => 0
    [encoding_translation] => Off
    [language] => neutral
    [detect_order] => Array
        (
            [0] => ASCII
            [1] => UTF-8
        )

    [substitute_character] => 63
    [strict_detection] => Off
)
```

By default, `mb_get_info()` returns an associative array of key/value pairs corresponding to all the internal parameters of `mbstring`. Some of the output (concerning web-related settings) has been omitted here and is dealt with in the relevant chapter. It is also possible to call `mb_get_info()` with a string argument corresponding to a parameter name:

```
print_r(mb_get_info('internal_encoding'));
print PHP_EOL;
print_r(mb_get_info('detect_order'));
```

```
Output:
UTF-8
Array
```
