```
preg_match_all('/(\w*)bo\w*/', $text, $matches, PREG_PATTERN_ORDER);
print_r($matches);
```

```
Output:
    [0] => Array
        (
            [0] => Cowboy
            [1] => bebop
        )

    [1] => Array
        (
            [0] => Cow
            [1] => be
        )
```

PREG_PATTERN_ORDER puts the full matches into one sub-array and the captured substrings into another. The alternative is to group matches and related captures together with PREG_SET_ORDER:

```
preg_match_all('/(\w*)bo\w*/', $text, $matches, PREG_SET_ORDER);
print_r($matches);
```

```
Output:
    [0] => Array
        (
            [0] => Cowboy
            [1] => Cow
        )

    [1] => Array
        (
            [0] => bebop
            [1] => be
        )
```

preg_quote()
