```
Output:
Array
(
    [0] => ?
)
```

Without enabling UTF-8 mode, `preg_match()` matches the first byte *0xF0*, which has no printing character in the ASCII codepage. If we enabled UTF-8 mode, though, we would get the same result as `mb_ereg()`:

```
preg_match('/./u', $squid, $matches);
print_r($matches);
```

```
Output:
Array
(
    [0] =>
)
```

Like `preg_match()`, `mb_ereg()` does not do global matching, nor is there any way to add modifiers to the expression.

```
$text = 'Cowboy bebop';
mb_ereg('(\w*)bo\w*', $text, $matches);
print_r($matches);
```

```
Output:
Array
(
    [0] => Cowboy
    [1] => Cow
)
```
