```
Output:
bool(false)
bool(true)
```

The `i` parameter puts the engine into case-insensitive mode for the duration of that one call. If an option needs to be persisted for several calls, we can do this:

```
mb_regex_set_options('i');
var_dump(mb_ereg_match('\x{141}\w+', "\u{142}ukasz"));
```

```
Output:
bool(true)
```

It is also possible to supply multiple options by combining them into a single string (we'll get to all the available options in a moment). The following shows the regex engine being set to both case-insensitive and *extended* modes (extended mode means that whitespace in the pattern is ignored unless escaped or used in a character class):

```
mb_regex_set_options('ix');
var_dump(mb_ereg_match('\w+ \s \w+ \s \x{141}\w+', "My buddy \u{142}
ukasz"));
```

```
Output:
bool(true)
```

The full set of options is given below:

Table 8-38. *`mbstring` regex options*

`i`	Ignore case (Unicode aware)
`x`	Extended mode (ignore whitespace)
`m`	`.` matches newlines
`s`	Enable anchor escape sequences `\A` `\Z`
`p`	Same as `m` and `s`
`l`	Longest match (see below)
`n`	Ignore empty (see below)
