```
$tstamp = mktime(
    hour: 25,
    day: 10,
);
print date('d H', $tstamp) . PHP_EOL;

$tstamp = mktime(
    hour: 12,
    minute: 61,
);
print date('H:i', $tstamp);

Output:
11 01
13:01
```

A handy trick with `mktime()` is the ability to express the final day of any month as the zeroth day of the next:

```
print "Final day of Feb 2024: " . date('d',
    mktime(hour:0, month: 3, day: 0, year: 2024)
) . PHP_EOL;

print "Final day of Feb 2025: " . date('d',
    mktime(hour:0, month: 3, day: 0, year: 2025)
);

Output:
Final day of Feb 2024: 29
Final day of Feb 2025: 28
```

Note that `mktime()` uses the currently configured timezone for its calculations, as the following demonstrates:

```
date_default_timezone_set('UTC');
$tstamp = mktime(
    hour: 5,
    minute: 0,
    second: 0,
    month: 9,
```
