

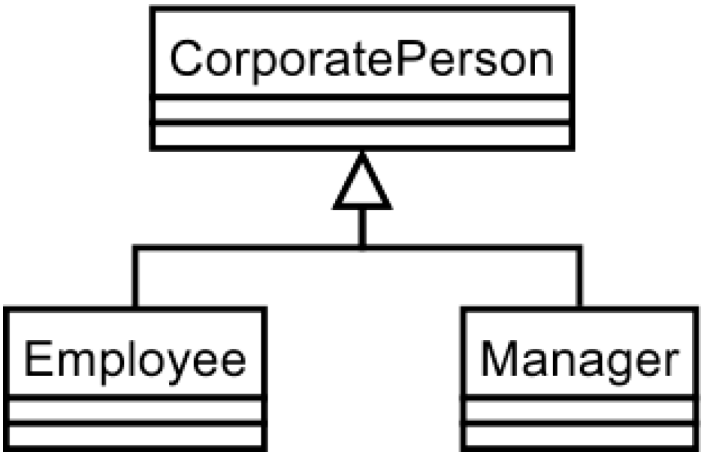

***Figure 10-3.*** *UML inheritance relationships*

Here we have two child classes, `Employee` and `Manager`, that are derived from a parent, `CorporatePerson` (because managers are employees too). Between the start of this section and creating the diagram, we were hit with extra requirements from HR, and we had to refine our design.

Going back to the concept of `Warehouse` and `Shop`, both needing to keep track of inventory, let's assume that warehouses and shops differ in how they control stock (one deals with single volumes, one with pallets perhaps) but share a common interface. We can model the relationship like this:

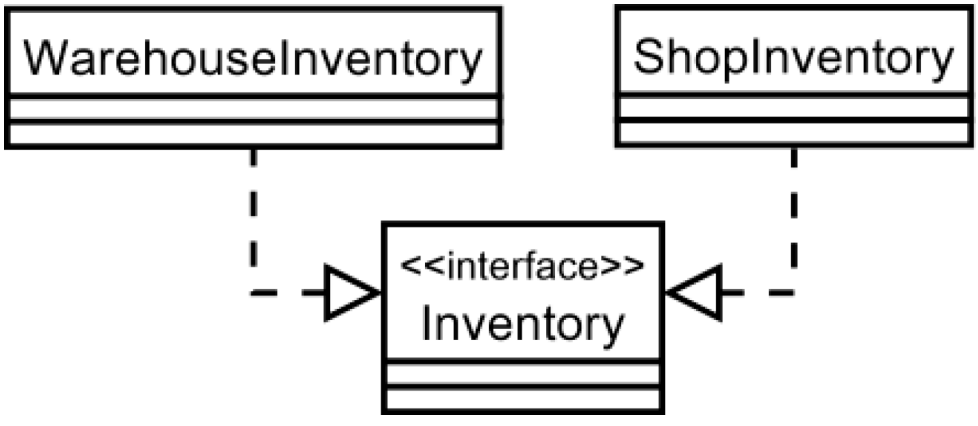

***Figure 10-4.*** *UML interface implementation*
