

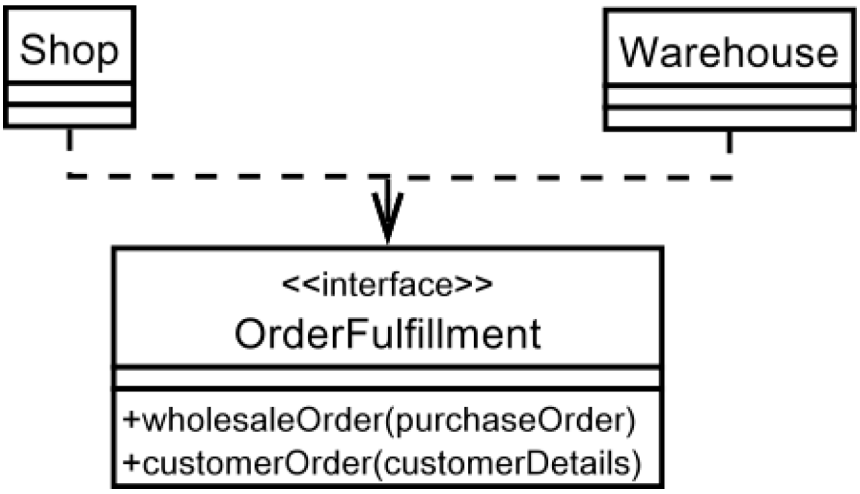

Figure 10-14. *`OrderFulfillment` offers more than any one of its clients needs*

On first glance, this might look OK. After all, `OrderFulfillment` looks nicely specialized to its job of placing orders. However, we now have a component that is offering `Shop` clients unnecessary wholesale order functionality, and likewise `Warehouse` clients are dealing with a component that allows customer order functionality, which `Warehouse` will never use.

There's also another problem. Remember single responsibility? If we consider the problem domain, we have two different sets of actors potentially driving change on `OrderFulfillment` – shop customers and warehouse managers. By ignoring the ISP, we have now violated the SRP.

The SOLID principles do not exist in isolation from each other. They are very much interrelated. Here's another example of how ISP relates to another SOLID principle.

```
class OrderFulfillment
{
    public function wholesaleOrder()
    {
        // wholesale stuff
    }
    public function customerOrder()
    {
        // customer stuff
    }
```
