There are, of course, corresponding write functions:

Table 1-6. *Write functions*

`fflush()`	Flushes buffered output to a file
`file_put_contents()`	Write data to file, either as an append or replacing entire file contents
`fputs()` `fwrite()`	Binary-safe write, appending data to the file
`fputcsv()`	Format an array of sub-strings to a single delimited format and append to file

In addition to reading and writing data, there are functions for performing other common filesystem operations:

Table 1-7. *Misc filesystem functions*

`chmod()`	Change file mode (permissions)
`chown()`	Change owning system account
`copy()`	Copy a file
`delete()` `unlink()`	Remove a file
`file_exists()`	Test that file or directory exists
`filegroup()`	Get group ownership
`fileowner()`	Get owning user account
`fileperms()`	Get permissions
`filesize()`	Get size in bytes
`ftruncate()`	Reduce file size to given length (loses data)
`glob()`	Find paths matching a pattern
`is_readable()`	Test file exists and is readable

(*continued*)
