```
// ... $html5 heredoc as before
$dom = Dom\HTMLDocument::createFromString($html5);
$meta = $dom->querySelector('head meta:first-child');
var_dump($meta->attributes);
foreach ($meta->attributes as $attr) {
    var_dump($attr);
}
```

```
Output:
object(Dom\NamedNodeMap)#3 (1) {
  ["length"]=>
  int(1)
}
object(Dom\Attr)#5 (21) {
  ...
  ["name"]=>
  string(7) "charset"
  ["value"]=>
  string(5) "utf-8"
  ...
```

... which returns a `Dom\NamedNodeMap` which can be iterated like an array as above, or you can grab a `Dom\Attr` from the collection by the attribute name, like this:

```
var_dump($meta->attributes->getNamedItem('charset'));
```

Attributes are easily removed via their names and added as name/value pairs:

```
$meta->removeAttribute('charset');
$meta->setAttribute('http-equiv', 'Content-Type');
$meta->setAttribute('content', 'text/html; charset=utf-8');
print $dom->saveHTML($dom);
```

```
Output:
<!DOCTYPE html><html><head>
  <meta http-equiv="Content-Type" content="text/html; charset=utf-8">
  ...
```
