Calling Functions

We can take a moment here to look at the mechanics of using Twig functions in expressions. Let's use `html_classes()` because it's pretty neat, and some of the other features of Twig while we're at it. Here's a reminder of the Twig boilerplate, including a call to load `HtmlExtension`…

```
// index.php
require_once __DIR__ . '/vendor/autoload.php';

use Twig\Extra\Html\HtmlExtension;

$loader = new \Twig\Loader\FilesystemLoader(__DIR__ . '/views');
$twig = new \Twig\Environment($loader);
$twig->addExtension(new HtmlExtension());

$state = new stdClass();
$state->errors = false;
$state->focused = true;

print $twig->render('html-classes.html.twig', [
    'classList' => [
        'flex', 'centered',
    ],
    'state' => $state,
]);
```

… our template looks like this…

```
{# views/html-classes.html.twig #}
<div class="{{ html_classes({
    'errors': state.errors,
    'focused': state.focused
}, ...classList) }}">
    Some content goes here.
</div>
```
