There is much more I could have written, but there is only so much space in the book. By going fairly deep on a limited set of core concepts (and the ones you'll most likely need to know about when working with a system powered by PHP), I hope I've shown you how to do the same with related topics. Omitted here were details on interacting with SMTP, FTP, DNS… but do not be alarmed. These protocols have their own RFCs and work in similar ways. If you understand the fundamentals of HTTP, you can easily learn the fundamentals of FTP and the rest. I hope I have ignited within you a desire to know and learn more, and everything you need is out there in the public domain. All of this technology is open, and nothing is stopping you from teaching yourself, just as I have been teaching myself all these years. Thank you for reading!
