So now, to install this, we run the following command:

---

composer require laravel/socialite

We then confirm that Socialite is available in your application. The Laravel automatically registers Socialite via package auto-discovery, so no extra provider configuration is required in the **config/app.php** file.

Configuring Socialite for a Provider

For this demonstration, you will integrate GitHub social login for which you open the **config/services.php** file and add the GitHub configuration settings. You may also need to obtain the client ID, client secret, and callback URL from your GitHub OAuth app registration by doing the following:

```
'github' => [

    'client_id' => env('GITHUB_CLIENT_ID'),
```
