```
php artisan make:controller SocialAuthController
```

Next, open the newly created controller file and add two methods: one to redirect the user to GitHub's authentication page, and one to handle the callback as below:

```
namespace App\Http\Controllers;

use Laravel\Socialite\Facades\Socialite;

use Illuminate\Http\Request;

class SocialAuthController extends Controller

{

    // Redirect the user to the GitHub authentication page.

    public function redirectToProvider()
```
