```
        return response()->json($githubUser);

    }

}
```

Next, update your **routes/web.php** file to include routes for these methods:

```
Route::get('/auth/github',
[App\Http\Controllers\SocialAuthController::class,
'redirectToProvider'])->name('auth.github');

Route::get('/auth/github/callback',
[App\Http\Controllers\SocialAuthController::class,
'handleProviderCallback'])->name('auth.github.callback');
```

This whole setup will empower your application to offer secure and seamless login experiences through social platforms.
