Recipe 4: Enforcing Two-Factor Authentication

You've already got secure user authentication, social logins, and role-based access control set up in the previous solution. And, now you want to add an extra layer of security with two-factor authentication (2FA). You and your team mentioned during the review meeting that 2FA is key to keeping accounts safe from unauthorized access. To meet this need, you decide to implement 2FA using Laravel Fortify, which integrates seamlessly with your existing authentication systems. We're going to walk through setting up Fortify for two-factor authentication, setting up the database columns you need, and testing the 2FA process in your Linux environment. And this feature makes it so that every login not only checks that we are who you say you are, but also asks you to do one more step to make your app even more secure.

Installing Laravel Fortify

In your “myapp” project directory, run the following command to install Laravel Fortify via Composer:
