composer require laravel/fortify

The Fortify serves as the backend authentication implementation, providing support for two-factor authentication along with other enhanced security features. Once Fortify is installed, you can publish its configuration file by running:

```
php artisan vendor:publish --
provider="Laravel\Fortify\FortifyServiceProvider"
```

This above command creates a **config/fortify.php** file where you can manage the two-factor authentication settings.

Configuring Two-Factor Authentication

Here, we want to store the two-factor authentication credentials, for which you have to ensure the users table includes the necessary columns, which you can do by opening the migration file (or create a new one), in which you add fields like **two_factor_secret** and
