```
php artisan make:model Tag -m
```

This command creates the Post and Tag models along with their associated migration files.

Defining One-to-Many Relationship

Since Laravel provides a built-in User model, we will enhance it by establishing that each user can have multiple posts. We will open the User model file and add the following method:

```
public function posts()

{

    return $this->hasMany(Post::class);

}
```
