Creating Pivot Table Migration

To support the many-to-many relationship, we need to generate a migration for the pivot table:

```
php artisan make:migration create_post_tag_table --create=post_tag
```

Next, open the newly created migration file (in the **database/migrations** directory) and set up the pivot table schema:

```
public function up()

{

    Schema::create('post_tag', function (Blueprint $table) {

        $table->id();
```
