Recipe 2: Creating and Executing Migrations

Next, we need to learn to lock down your database design with migrations. This is a key part of your Laravel development workflow. In team chat recently, you said that having migration files ready makes it so your whole team can version control and sync database schema changes without a hitch. Here's how to generate those migration files using Artisan commands and run them on your Linux system.

Generating Migration Files

If you want to generate a migration for, let's say, a new "Comments" table, here's the Artisan command we will need to use:

---

php artisan make:migration create_comments_table --create=comments

---

This command creates a migration file in the
