```
$posts = App\Models\Post::all();

foreach ($posts as $post) {

    $comments = $post->comments; // Each iteration fires an extra query

}
```

This results in one query to fetch posts plus one additional query per post to retrieve its comments, which can overwhelm the system as the number of posts increases.

Implement Eager Loading

To optimize this, we need to update your query to use Laravel's eager loading feature. In your controller method (for example, in PostController):
