```
$posts = App\Models\Post::with('comments')->get();
```

This single modification instructs Laravel to fetch all posts and load all associated comments in just two queries—one for posts and one for the comments.

Verify Performance

Since we have Laravel Debugbar already installed in your app via Composer, you may simply run your application using:

```
php artisan serve
```

Then navigate to the page where posts and comments are displayed. With Laravel Debugbar active, observe the number of queries executed. You should see that instead of multiple queries for each post, only two queries are executed regardless of the number of posts.
