Laravel's got a solid validation engine that's both powerful and elegant. The Validator makes it simple to enforce rules on any incoming request. With a syntax that is both expressive and flexible, you can specify multiple validation rules for your data in one place. Laravel's validation system gives you clear error messages so you and your users know what needs to be corrected.

Implementing Server-Side Data Validation

We consider that we have a controller handling a user registration request. We open the controller file (for example, and modify the registration method as follows:

```
public function register(Request $request)

{

    // Define the validation rules based on business requirements

    $rules = [
```
