Based on the above script, the **validate()** method automatically checks the incoming request data against the defined rules.

The **name** field is required, must be a string, and can only contain alphabetic characters and spaces.

The **email** must be correctly formatted, unique in the users table, and within the proper length.

- The **password** requires confirmation and must meet a minimum length.

If any of these rules fail, Laravel will automatically return a response with error messages, prompting the user to make the necessary corrections.
