Recipe 2: Custom Validation Rules & Feedback

With maturity reaching your app, you may recognize that the built-in validation rules sometimes do not cover all of your business needs. So, in your development meeting, you noted that certain inputs require specialized checks beyond what Laravel's default validators provide. For example, you may need to validate that a username doesn't contain prohibited words or that a discount code follows a custom pattern. Your goal is to provide precise, helpful error messages so that end users know exactly what to correct when their inputs do not meet your unique criteria. Here, you will craft custom validation rules in your app and implement tailored feedback to guide users clearly.

Writing Custom Validation Logic

Let's say you need to make sure a username doesn't have any banned terms. In your controller, go ahead and modify the validation rules by adding a closure for the custom validation logic. For example, in a registration method:

---

public function register(Request $request)
