will see the default implementations provided by Laravel.

In the **report()** method, you can add custom logic to log additional details or integrate third-party error tracking services. For instance, you might decide to only log critical exceptions or format them in a specific structure. The default implementation already uses Laravel's logging facilities via the Log facade. You can adjust the logic as needed as shown in the following:

```
public function report(Throwable $exception)

{

    // Customize logging, or integrate with an error tracking service like Sentry.

    if ($this->shouldReport($exception)) {

        \Log::error('Exception occurred: ' . $exception->getMessage(), [

            'exception' => $exception
```
