This command creates a configuration file at **config/pulse.php** and publishes the necessary frontend assets required for the Pulse dashboard. After this, try reviewing the configuration file to familiarize yourself with available options such as log levels, update frequencies, and dashboard styling.

Configuring Logging Channels

Now in order to confirm that the Pulse captures the right logs, we will configure a dedicated logging channel in your Laravel application. For this, we will first open the **config/logging.php** file and add a new channel named

---

```
'channels' => [

    // ... existing channels

    'pulse' => [

        'driver' => 'daily',

        'path' => storage_path('logs/pulse.log'),

        'level' => 'error',
```
