can log custom messages to the Pulse channel. For instance, in one of your controller actions, you might add:

```
use Illuminate\Support\Facades\Log;

public function processData()

{

    // Simulate a critical error condition

    try {

        // Some code that might fail

        throw new \Exception('Simulated critical failure in processData.');

    } catch (\Exception $e) {

        Log::channel('pulse')->error('Critical error in processData method', [

            'error'   => $e->getMessage(),
```
