}

Here, in the above, the event carries a message and sender information. It is broadcast on a public channel named “chat” and is identified by the event name

Now we try to trigger the event for which, in one of your controller methods (for example, in a ChatController), we try to fire the event when a new chat message is created by changing the controller file as below:

```
namespace App\Http\Controllers;

use App\Events\NewChatMessage;

use Illuminate\Http\Request;

class ChatController extends Controller

{
```
