videos, or interfacing with third-party APIs. Laravel supports multiple queue drivers like database, Redis, Beanstalkd, and Amazon SQS. For simplicity and leveraging existing infrastructure, we will use the database queue driver in this demonstration. The database driver uses a table in your existing database to store queued jobs, making it an excellent choice for development and small-scale production environments.

Set Queue Connection

You can set the queue connection to database by adding or editing the following line:

QUEUE_CONNECTION=database

This instructs Laravel to use the database queue driver, which stores job entries in a dedicated table.

Create Jobs Table

The Laravel requires a table to store the queued jobs when using the database driver. For this, you can generate the
