We need a sample job to simulate a heavy task that you want to process in the background. And for this, you need to generate a new job class called

---

php artisan make:job ProcessHeavyTask

This creates a new file in

Implement Job Logic

Now, open **ProcessHeavyTask.php** and update it to include logic that simulates heavy processing. Here, you can use a sleep command to mimic a long-running task:

---

namespace App\Jobs;

use Illuminate\Bus\Queueable;
